

Acoris

Credit that proves itself.

AI-negotiated DeFi lending on Creditcoin CC3 Testnet — priced only on financial history that has been cryptographically verified, never assumed.

BUIDL CTC Fall 2026

• Live on CC3 Testnet • Chain 102031

github.com/TeevinosCrypt/Acoris

DeFi lending treats every wallet as a stranger

No context

A wallet's real repayment history — on this protocol or any other — carries no weight in how the next loan is priced.

Start from zero, every time

Borrowers rebuild trust from nothing on every new protocol, no matter how much genuine repayment history they actually have elsewhere.

Claims aren't proof

A self-reported "I've always repaid on time" is easy to say and impossible for a lender to check without doing the verification work themselves.

Verified evidence prices the deal. Nothing else does.

A borrower proves a real repayment — cross-chain via Attestcoin, or natively on Creditcoin — and that becomes evidence a Lender AI is allowed to price favorably. An unverified claim is priced *exactly* like no claim at all, by construction, not just by prompt.

01

Two AI agents negotiate structured terms — a Borrower AI and a Lender AI.

02

Deterministic code — never the model — enforces every hard limit on both sides.

03

Accepted terms settle as a real transaction: collateral escrowed, principal funded, repayment tracked on-chain.

The loop

Verify

Bring a real repayment.
Attestcoin proves it cross-chain, or Acoris reads native CC3 loan history directly.

Negotiate

A Borrower AI and a Lender AI exchange structured offers. Deterministic code clamps every limit.

Fund

The agreed terms become a real agreement on Creditcoin. Collateral is escrowed by the contract.

Repay

Repayment returns collateral — and becomes verified evidence for the next negotiation.

What actually talks to what

The AI proposes. It never enforces. Every accepted term is checked against deterministic limits before it becomes a real transaction.

Eight real, working routes

[/credit-profile](#)

Bring real evidence, see exactly what a lender would see.

[/marketplace](#)

Three lender personas independently price the same request; the best affordable offer wins by an explainable rule.

[/negotiation](#)

The Borrower AI / Lender AI negotiation itself, round by round.

[/underwriting](#)

The real pricing formula, narrated. No AI call — works with no API key.

[/improve](#)

"How do I get better terms?" — real projections, never a promised rate.

[/agreement](#)

Where a lender finds and funds a proposed deal.

[/dashboard](#)

Real on-chain history, plus a live count of loans awaiting your review.

[/attestcoin](#)

The standalone cross-chain verification flow, end to end.

This is live, not a mockup

CC3 Testnet (chain 102031)

Full cycle

Propose → fund → repay run live,
on-chain, with real transactions

3 real bugs

Found and fixed by reproduction
during live testing — not guessed at

175 tests

135 unit + 20 real-EVM contract
tests, plus 3 end-to-end browser
suites

No fake transaction hashes. No fabricated scores. No simulated confirmations. Where something genuinely couldn't be verified from this build environment, the project's own docs say so explicitly.

Built on

FRONTEND

Next.js 16 · React 19 · TypeScript · Tailwind v4

CHAIN

ethers v6 · Creditcoin CC3 Testnet

NEGOTIATION

Claude (Anthropic API) — proposes only, never enforces

CONTRACT

Solidity · Hardhat 3 · real-EVM Mocha tests

CROSS-CHAIN PROOF

Attestcoin / @gluwa/usc-sdk — BlockProver precompile

VALIDATION

Zod at every request boundary
